Lab Control Center Introduction

Starting the Lab Control Center

You can start the Lab Control Center (LCC) from ubuntu's application menu, or from the terminal:

```
cd dev/software/lab_control_center/
./run.bash
```

After you successfully started the LCC software, you can get familiar with the UI looking here.

The LCC is a GUI that allows monitoring and control of various aspects of the lab. It has two main purposes,

1. to start and stop an experiment, and
2. to visualize the current state of the experiment.

Read more about the LCC on its dedicated page.
